Assignment 4

Q1. Shared-memory communication

1. Create a shared-memory object with a size of three pages and attach the current process to it.
2. Write data into each page of the shared-memory region.
3. Create a child process and access the shared-memory region from the child. Verify that the child can read the data written by the parent from every page.
4. Repeat the experiment using two unrelated processes (not a parent and child).
5. Write data into the shared-memory region from one process and read the same data from the other process.
6. Verify access to every page of the shared-memory region and document how both processes attach to the same shared-memory object.

Terminal
Terminal
Terminal
desd@desd-OptiPlex-5050:Asiignment_4$ ./writer
data return across 3 pages successfully..
Waiting for reader to read data so added little sleep

Terminal
Terminal
Terminal
desd@desd-OptiPlex-5050:Asiignment_4$ ./reader
Reader succefully attached to shared memory..
Reader 1st -> This is from writer : this is page 1
reader 2nd -> this is from writer : this is page 2
reader 3rd -> this is from writer : this is page 3
desd@desd-OptiPlex-5050:Asiignment_4$
